

CREATIVE DEVELOPMENT · DELIVERY REPORT

Grain that moves *life forward.*

A full art-direction, motion, responsive-engineering and production pass over the Nafaka Foods website — what was built, what was verified, and what comes next.

PREPARED FOR

Nafaka Foods Limited

DATE

16 September 2026

LIVE WEBSITE

cartelug.github.io/Nafaka_Foods_Website/

RELEASE COMMIT

f58cced

A rebuild around *one idea*.

The company's positioning, facts, contact details, WhatsApp enquiry logic, page addresses and approved photography are unchanged. Everything around them was rebuilt: the art direction, the layout system, the motion, the accessibility and the production code.

01	Art direction	A single concept — grain in motion — expressed through composition, rule-work and timing rather than added effects. Six tonal surfaces give each page a distinct character inside one system.
02	Responsive build	Mobile and desktop are separate compositions, not one stacked layout. Verified at twenty-one widths from 320px to 1920px, including the intermediate sizes between named devices.
03	Motion system	Four movement verbs on one timing scale, plus a branded preloader with four independent fail-safes. No animation library.
04	Accessibility	Zero automated WCAG 2.0 / 2.1 A and AA violations across all six pages, a designed reduced-motion mode, and a document that works with JavaScript switched off.
05	Engineering	No frameworks or dependencies. One stylesheet, two small scripts, a single animation loop, and a page generator so the shared chrome is written once.

THE COMMERCIAL JOB THE SITE HAS TO DO

Rice leads. Every rice variety on the range page opens a WhatsApp enquiry with that variety already selected. Grain supply and smart vending are named as two separate routes before the contact form, and the form adapts to whichever the visitor picks — asking for a quantity for grain, and for building context for vending.

Release

Live website	https://cartelug.github.io/Nafaka_Foods_Website/
Repository	cartelug/Nafaka_Foods_Website
Release commit	f58ccedada1470f10ffa7c9e75136464a77c52ee
Deployed	16 September 2026 — GitHub Pages build and deployment, succeeded
Pages	Home, Our story, Grain range, Smart vending, Contact, plus a 404 page

Grain in *motion*.

The approved hero photograph already contained the idea: a specialist letting rice fall into a brass sampling pan. The whole interface is built from that one gesture, so the design belongs to Nafaka rather than being decoration applied afterwards.

–	The route rule	Every section opens with a hairline that draws from left to right, carrying a number and a label. The rule is the supply route; the sections are stations on it. This is what gives the site its rhythm.
–	The fall	Headlines arrive downward through a mask, the way grain drops into the pan – never a generic fade. The preloader clears downward and the headline falls in the same direction, so the movement is handed over rather than cut.
–	Measure ticks	Buyers, rice varieties, commodities and metadata sit on fine rules with lined-up numerals, like a sorting register – in place of rows of repeated cards.
–	The aperture	Photographs open from a clip and settle back to full size, rather than fading in.

The tonal journey

Sections are paced deliberately instead of being uniformly coloured, so the page has light and shade as a reader moves down it.

Opening	Bright and assured – the hero and the brand statement on ivory and rice white
The range	Deep forest green, with brass numerals for the rice varieties
Who we supply	Back to ivory, as a ruled register of buyers
Origin story	The deepest surface, with the Kabale narrative and the milestone figures
Smart vending	Brass-lit, with a tighter and more mechanical cadence
Closing	Warm rice white, with three named routes into an enquiry

WHAT WAS DELIBERATELY AVOIDED

Centred headings above three identical cards, endless rounded rectangles, gradient blobs, neon glows, floating badges, decorative icon libraries, marquees that run for their own sake, fake loading counters, cursor gimmicks, and sections added only to make the page longer. Where the previous build used an endlessly scrolling banner of commodity names, the same names are now real links into the range – navigation rather than ornament.

One system, *six surfaces*.

Each section declares which surface it sits on. That single declaration resolves the background, the text colour, the quiet text, the accent, the rules and the focus ring for everything inside it — which is why the pages look varied without the code becoming a pile of exceptions.

Colour

Sampled from the approved photography: the forest workwear, the brass sampling pan, the cream lime-washed wall, the milled rice.

Deep forest	#071B12 / #0A291D / #123827	Range, origin story and vending surfaces
Rice & ivory	#FFFDF8 / #F6F0E3 / #E8DEC9	Opening, register and closing surfaces
Botanical green	#5C8B46 / #3D6630	Graphic marks, and a darker tone for small text
Brass	#B58A45 / #D8B877	Rules and numerals; the lighter tone for text on dark
Ink	#17241B / #4D574F	Body text and quiet text on light surfaces

Two greens exist on purpose. The lighter one is used for graphics; a darker one is used for small text, because the lighter green cannot carry the required 4.5:1 contrast at label sizes.

Typography

Newsreader for display and editorial emphasis, Manrope for interface and body text. Both are self-hosted, so no third party is involved in rendering the page. Thirteen registers run from the hero headline down to metadata, all scaling fluidly rather than stepping at breakpoints. Italic is reserved for editorial emphasis inside display type and is used nowhere else.

Layout

One container, expressed as padding rather than a fixed width, so full-bleed strips can align their first item to exactly the same line as the rest of the page. Compositions reflow at three shared points: where lists become columns, where full-width text splits in two, and where a photograph may sit in a column beside type.

WHY THE 900-1023PX BAND MATTERS

A wide photograph placed in a narrow column crops the subject into a near-square and cuts the very thing the picture is about. Image-beside-text compositions therefore require a genuine landscape frame before they engage. Below that, the layout keeps its stacked form — which is why a large tablet shows the whole photograph rather than a tight crop of it.

Four verbs, *one grammar*.

Movement carries meaning here rather than being applied for its own sake. Each verb has a fixed job, so a reader learns the language of the site without noticing. Nothing animates outside these.

VERB	MEANING	USED ON
Fall	Arrives downward through a mask	Display type and headlines
Advance	Enters from the left, along the direction of supply	Lists, rows and links
Open	An aperture lifts and the image settles back	Photography
Settle	Resolves in place; carries the stagger	Metadata and supporting copy
Draw	The route rule extends left to right	Section rules only

TIMING

170ms	Pointer feedback — nothing spatial
340ms	A state change the visitor asked for
760ms	Content arriving as the page is read
1150ms	Page-scale choreography

Some things are deliberately still — body copy in the first screen, the navigation, every form field. That contrast is what makes the movement read.

The preloader

A single brass grain travels in, settles into the Nafaka mark, and the mark draws itself. The gate then clears downward, uncovering the navigation first while the headline falls in the same direction — about 1.7 seconds, once per visit, and never for a visitor who has asked for reduced motion.

FOUR INDEPENDENT FAIL-SAFES

A preloader that can trap a page is worse than none, so four separate mechanisms can each end it independently:

- If JavaScript does not run, the preloader never appears at all — it is not in the page's critical path.
- A stylesheet rule clears it at 2.4 seconds even if the main script never loads.
- The script enforces a hard 1.8-second ceiling regardless of the network.
- A small start-up script releases every hidden state at 3 seconds if the main script never arrives.

Five pages, *one voice*.

01 Home

Two separate hero compositions. On a phone: the headline, then the whole photograph inside the first screen, then the supporting copy and actions. On a laptop: the photograph framed below the navigation, with the type set on the lime-washed wall the photographer left empty and held to 44% of the width so no letterform ever crosses the subject. Below it, the commodity register, the brand statement, the rice range, a ruled index of buyers, the origin split, the vending hand-off and a closing panel with three named routes.

02 Our story

A documentary chronology rather than a corporate timeline: the year is the anchor and each entry advances from the route line. Purpose, direction and values sit on the same register system. No milestones were invented – the page carries 2016, 2023 and a forward-looking entry, and nothing else.

03 Grain range

Rice leads. Each variety is a full-width row that opens an enquiry with that variety already selected. Maize, beans and soya form a ruled three-name register rather than coloured cards, and the wider scope sits in a separate note. No technical specifications, grades or pack sizes were invented; the page says these are confirmed by the team.

04 Smart vending

A tighter, more mechanical cadence: tabular spec columns, a five-step placement sequence, squarer rules. Distinct from the grain pages while staying recognisably Nafaka. The upright vending photograph now runs in an upright frame, so the machine, the contactless reader and the person all stay inside the crop.

05 Contact

Two routes – grain supply and smart vending – are named before the form, and either one sets the form in place. Inline validation with messages that never rely on colour alone, visible focus, a live status message, and the WhatsApp draft shown in full for review before anything opens. Nothing is ever sent automatically.

NOTHING HIDDEN BEHIND A HOVER

Every interaction has a touch equivalent. There is no information anywhere on this site that can only be reached with a mouse, and the mobile menu is built on a native browser control so it opens even with JavaScript switched off.

The first *ten seconds*.

The phone screen was treated as the highest-priority surface, on the assumption that a buyer most often opens the link from a WhatsApp message. So it is its own composition rather than the desktop one stacked — and the whole photograph lands inside the first screen.

GRAIN RANGE

SMART VENDING

OUR STORY

CONTACT

Every image kept *its role*.

No photograph was replaced, generated, recoloured or moved to a different subject. Each one is still used in exactly the role it already held, and an automated check now fails the build if a role moves between pages.

IMAGE	ROLE
Rice hero	Homepage hero — separate desktop and upright mobile compositions
Four rice bowls	Homepage range stage and the Grain range masthead
Kitchen buyer	Homepage origin story
Vending machine	Homepage vending band, and the Smart vending masthead

How presentation was improved

Only through art direction: the existing desktop and mobile variants, controlled crops, fixed aspect frames so nothing shifts while loading, aperture reveals, parallax capped at a very small distance, and two soft tonal veils placed so the headline stays legible over the photograph without washing out the light the photographer captured.

One deliberate change: the Smart vending page now serves the upright vending composition at every width, because that page's picture column is an upright frame. It is the same approved photograph in the variant prepared for that shape — and the result is that the machine, the reader and the person all stay in the crop, where previously the person was cut off.

PLEASE NOTE

The campaign imagery is illustrative brand photography. It is not documentary evidence of Nafaka staff, customers, facilities, stock or certifications, and the website does not present it as such. This is recorded in the repository alongside the images.

Part of the design, *not a patch.*

A Ugandan grain business selling to schools, health facilities and government institutions should have a website those institutions can actually use. Accessibility was treated as a quality of the design rather than a checklist applied at the end.

Automated WCAG 2.0 and 2.1 A + AA scan, all six pages	0 VIOLATIONS
Lowest text contrast anywhere in the colour system	5.00 : 1
Every function reachable by keyboard alone	VERIFIED
Visible focus ring on every control, on light and dark	VERIFIED
Page readable and navigable with JavaScript off	VERIFIED
Layout holds at 200% zoom	VERIFIED
Minimum tap target on a phone	44 × 44 PX

What that means in practice

- A skip link is the very first thing a keyboard visitor reaches, and it moves focus into the main content.
- The mobile menu is built on a native disclosure, so it opens even without JavaScript. With JavaScript it also locks the background, keeps focus inside the panel, and returns focus to the button when it closes.
- Form errors appear beside the field, are announced to screen readers, and never rely on colour alone to communicate the problem.
- Inputs are set at a size that stops phones zooming in when a field is tapped.

REDUCED MOTION

Some people experience motion sickness from moving interfaces, and their device can say so. On this site that setting produces the same compositions arriving instantly — no preloader, no parallax, no scroll effects, and nothing left invisible. It is a designed mode, not a broken version of the page.

Built for an ordinary *Android phone*.

The site targets real devices on ordinary mobile networks, not flagship handsets on office broadband. There are no frameworks and no third-party dependencies of any kind – nothing on the page is fetched from anyone else's server.

FILE	SIZE	SENT AS
Stylesheet	73.5 kB	16.7 kB compressed
Main script	30.0 kB	8.8 kB compressed
Enquiry builder	1.5 kB	0.8 kB compressed
Homepage markup	22.9 kB	5.7 kB compressed
Two brand fonts	34.3 kB	Self-hosted, subset

The stylesheet is heavily commented on purpose, so whoever maintains it can read the reasoning. Comments cost nothing once compressed.

How the movement is kept cheap

- A single animation loop drives every scroll-linked value on the page. Positions are measured once and re-measured only when the window changes or the fonts land – never while scrolling.
- Only properties that the graphics hardware can handle are animated. Nothing that forces the browser to recalculate the layout moves during a scroll.
- Parallax is capped at a very small distance and switched off entirely on touch devices, where it would otherwise fight the natural feel of scrolling.
- Every image declares its dimensions, so nothing jumps around while the page loads.
- Every event listener is released when the visitor leaves the page, so returning via the back button never leaves duplicated behaviour behind.

WHY THERE IS NO ANIMATION LIBRARY

Everything the motion system needs is built into modern browsers. A library would have added weight to every page load and created a second source of truth for timing, without changing a single frame on the devices this site is built for.

What was actually *checked*.

The site was not signed off by looking at the code. It was loaded in a real browser and driven automatically – the checks below all pass against the exact version that is live.

Source, metadata, token and contrast checks	1,650 PASSED
WhatsApp message-builder tests	8 PASSED
Layout across widths, six pages each	21 WIDTHS
Accessibility scan at phone and laptop size	0 VIOLATIONS
200% zoom, three screen sizes	PASSED
JavaScript disabled, six pages	PASSED
Reduced motion, six pages	PASSED
Repeat navigation and browser back	PASSED

Also verified by machine

- Every internal link and every in-page anchor on every page resolves.
- The mobile menu opens, traps focus, closes on Escape, returns focus to its button, releases the background, and is never left open after a back-button navigation.
- Submitting the contact form empty does not navigate away and explains what is missing; a completed enquiry produces a WhatsApp draft addressed to the correct number, with the preview text and the link matching exactly.
- Choosing smart vending hides the quantity field and requires building details instead – and a stale quantity never survives into the message.
- An unrecognised product in a link falls back to a general rice enquiry rather than being accepted.

NO TEST EVER SENDS AN ENQUIRY

The automated checks inspect the generated WhatsApp link as text. They never open it and never contact any external service, so no test message has ever reached the business number.

What would move this *furthest next*.

These are recommendations in priority order, not commitments. Nothing here is scheduled or priced — see the note at the end of this section.

01 Confirm the outstanding facts

Costs nothing and improves the site immediately. The details listed on the final page were deliberately left out rather than invented. Each one confirmed is a question a buyer no longer has to ask.

02 A custom domain

The site currently lives at a github.io address. A Nafaka domain would carry considerably more weight with an institutional buyer, improve search visibility, and allow matching business email. GitHub Pages supports this directly and issues a certificate automatically.

03 Replace campaign imagery with real photography

The single biggest available gain in credibility. Genuine photographs of Nafaka's own rice, people, stock and premises would let the site show the business rather than represent it. The layouts are already built around the same crops, so replacement is straightforward — the guidance is recorded in the repository.

04 Know whether it is working

There is currently no measurement of any kind. Knowing how many people reach the contact page, which rice varieties are opened most, and how many enquiries begin would turn the site into something that can be improved with evidence rather than opinion. This should be chosen with privacy in mind.

05 Keep the content current

As grades, varieties or vending locations change, the pages should follow. The build is arranged so the shared header, footer and metadata are written once, which makes routine edits low-risk.

WORTH CONSIDERING LATER

- Individual pages for each rice variety, once there is confirmed detail to put on them.
- A short, honest set of client references or case notes, if any customer is willing to be named.
- A downloadable company profile or capability statement for institutional procurement.
- A map or list of the areas actually served, once coverage is confirmed.

ON COMMERCIAL TERMS

This document deliberately contains no fees, rates or timelines. None were agreed for this pass, and inventing them would be worse than leaving them out. Any of the items above can be quoted separately once scope is chosen.

What the site does *not* say.

Everything below was left off the website on purpose, because it could not be confirmed. Publishing a guess about any of it would risk a commitment the business had not actually made. Each item is ready to be added as soon as it is confirmed.

AREA	NOT PUBLISHED
Product	Pack sizes, minimum order quantities, current grades, current stock
Commercial	Prices, payment terms, discount structures
Delivery	Delivery times, delivery guarantees, geographic coverage
Credentials	Certifications, customer counts, named clients, partnerships, market share
Capacity	Warehouse capacity, branch locations, stocking frequency
Vending	Payment technology, machine capacity, refill schedules, availability guarantees

ONE CONFLICT TO RESOLVE

The two company documents provided list different street addresses. Rather than choose between them, the website publishes only the postal address they share — P.O. Box 10463, Kampala. Confirming the correct street address would let a physical location be shown, which matters to institutional buyers.

Where everything lives

Live website	https://cartelug.github.io/Nafaka_Foods_Website/
Source code	github.com/cartelug/Nafaka_Foods_Website
Release commit	f58ccedada1470f10ffa7c9e75136464a77c52ee
Technical notes	REVIEW.md in the repository
Image provenance	assets/IMAGE-PROVENANCE.md in the repository

The website is a static site. It requires no build step, no server and no database, and hosting is currently free. That is a deliberate choice: it keeps running costs at essentially nothing and means there is no software to keep patched.
